

Monthly IT Operations Report

Nimbus Notification Gateway — January 2026

Report Period	January 2026	Department	IT Operations
Report ID	ITOPS-NNG-2026-01	Report Date	06 January 2026
Generated Time	06 January 2026, 12:37 WIB	Report Status	Final
Primary Application	Nimbus Notification Gateway	Supporting Server	Vespera Integration Node
Supporting System	Atlas Workflow Console	Reporting Cycle	Monthly

Executive Summary

Nimbus Notification Gateway operated as the enterprise notification delivery layer for application-generated email, SMS, and workflow alerts during January 2026. The month was characterized by stable message throughput, one short-lived delivery degradation, and improved monitoring coverage for queue depth and provider response latency. Overall service availability remained within the monthly operational target, while most support requests concerned delayed notifications, recipient configuration, and delivery-status checks.

99.62%	1,486,230	19	96.1%
Gateway Availability	Messages Processed	Incidents	SLA Compliance

Operational posture: **Stable**. Notification throughput was consistent with expected business activity. The principal watch item was transient provider latency that increased queue depth during a peak processing window but recovered without data loss.

1. Managed Application & Service Overview

Nimbus Notification Gateway is a centralized notification orchestration service used by business applications to submit notification requests and receive delivery status. It normalizes outbound requests, applies routing rules, manages retry queues, and exposes delivery outcomes to dependent applications.

Component	Role	Operational Scope	Status
Nimbus Notification Gateway	Primary notification service	Email, SMS, workflow alerts, retry and delivery status	Operational
Vespera Integration Node	Supporting server	API integration, queue workers, provider connectivity	Operational
Atlas Workflow Console	Supporting system	Workflow-triggered notifications and status callbacks	Operational

Core Service Functions

Function	Description	January Observation
Notification Intake	Accepts notification requests through secured application APIs.	Stable intake rate; no sustained rejection pattern.
Routing & Template Processing	Selects channel, template and recipient routing rules.	Minor configuration corrections handled through support.
Queue & Retry Management	Buffers requests and retries transient delivery failures.	Queue depth peaked during provider latency event.
Provider Delivery	Submits outbound messages to external delivery providers.	Email remained dominant; SMS volume increased near month-end.
Delivery Status	Captures accepted, delivered, failed and retried outcomes.	Status callback completeness remained above target.

2. Application Availability & Performance

Performance was monitored across gateway availability, message processing latency, queue depth, provider response time and supporting infrastructure health. A short provider-side latency event affected delivery timing but did not result in permanent message loss.

Indicator	Target	Actual	Assessment
Gateway availability	≥ 99.50%	99.62%	Within target
Average processing latency	≤ 450 ms	286 ms	Healthy
P95 processing latency	≤ 900 ms	742 ms	Within target
Peak queue depth	≤ 8,000	6,840	Within threshold
Delivery-status callback success	≥ 98.0%	98.7%	Healthy
Supporting server uptime	≥ 99.50%	99.91%	Healthy

Application Performance Indicators

Metric	Week 1	Week 2	Week 3	Week 4	Month
Messages processed	346,180	361,420	382,760	395,870	1,486,230
Avg. processing latency	271 ms	279 ms	301 ms	293 ms	286 ms
Failed submissions	0.42%	0.37%	0.51%	0.44%	0.44%
Retry rate	1.08%	1.14%	1.31%	1.17%	1.18%

Performance note: the highest queue depth occurred during a 47-minute period of elevated provider response time. Automated retries cleared the backlog after provider latency returned to normal operating range.

3. Application Incident Management

A total of 19 incidents were recorded. Most were low-to-medium severity operational events involving delivery delay, configuration, provider response, or status synchronization. No critical incident resulted in confirmed message loss or prolonged service unavailability.

Incident ID	Date	Severity	Category	Resolution / Outcome
INC-NNG-2601	04 Jan	Medium	Provider latency	Traffic stabilized; retry queue drained automatically.
INC-NNG-2605	08 Jan	Low	Template configuration	Incorrect template mapping corrected and validated.
INC-NNG-2610	15 Jan	Medium	Delivery delay	Queue worker restarted; delayed messages processed.
INC-NNG-2614	21 Jan	Low	Status callback	Callback reconciliation completed; no message loss.
INC-NNG-2618	27 Jan	Medium	SMS provider response	Provider route normalized; retry policy completed delivery.

Incident Summary

Severity	Count	Resolved	Open at Month End
Critical	0	0	0
High	1	1	0
Medium	7	7	0
Low	11	11	0
Total	19	19	0

4. Application Support / Ticket Management

Support activity focused on notification delivery checks, recipient issues, template changes, delivery-status verification, and integration questions. A total of 154 tickets were logged, with 96.1% meeting the applicable SLA target.

Category	Tickets	Share	Primary Pattern
Delayed / missing notification	43	27.9%	Recipient did not receive expected alert
Template / content	31	20.1%	Template update or formatting question
Recipient / routing	28	18.2%	Recipient mapping and channel routing
Delivery status	22	14.3%	Verification of delivered / failed status
Integration / API	17	11.0%	Submission and callback integration
Other	13	8.4%	Access, reporting and general queries
Total	154	100%	—

Support Outcome

The largest ticket category was delayed or missing notifications. Investigation generally found transient provider latency, recipient-side filtering, or configuration mismatch rather than gateway processing failure. Knowledge articles were updated for common delivery-status checks to reduce repeated escalation.

5. Maintenance Management

Maintenance activity concentrated on queue-worker configuration, delivery retry policy tuning, monitoring thresholds, and template-routing configuration. Changes were scheduled outside peak notification windows where practical.

Activity ID	Date	Type	Activity	Result
MNT-NNG-01	05 Jan	Planned	Queue worker configuration review	Completed; processing stability improved.
MNT-NNG-02	10 Jan	Planned	Delivery retry threshold tuning	Completed; transient failure recovery improved.
MNT-NNG-03	16 Jan	Planned	Monitoring threshold adjustment	Completed; queue alerts became more actionable.
MNT-NNG-04	22 Jan	Planned	Template routing validation	Completed; no production issue identified.
MNT-NNG-05	29 Jan	Planned	Provider endpoint connectivity test	Completed; connectivity within expected range.

Maintenance KPI	January Result
Planned maintenance activities	5
Planned maintenance completed	5
Unplanned maintenance	1
Total maintenance downtime	0h 52m
Change success rate	100%

6. Key Highlights & Observations

Area	Observation	Operational Impact
Notification throughput	1.49 million messages processed with stable weekly growth.	Service remained within expected capacity.
Provider latency	One short latency event increased retry queue depth.	Delivery timing temporarily degraded; backlog cleared automatically.
Monitoring	Queue depth and provider latency thresholds were refined.	Earlier operational detection and clearer alerting.
Support demand	Delivery-delay questions remained the dominant ticket type.	Opportunity to improve user-facing delivery-status guidance.
Data integrity	No confirmed permanent message loss was identified.	Business notification integrity maintained.

7. Recommended Actions

Priority	Recommended Action	Owner	Target
High	Introduce provider-latency trend dashboard with queue-depth correlation.	IT Operations	February 2026
High	Review retry and dead-letter queue thresholds against month-end traffic profile.	Platform Engineering	February 2026
Medium	Expand delivery-status knowledge articles for service desk teams.	Service Desk	February 2026
Medium	Validate recipient-domain filtering guidance with business application owners.	Application Support	March 2026
Low	Assess SMS provider routing redundancy for peak notification periods.	Infrastructure	March 2026

8. Structured Extraction Reference

The following fields are intentionally presented in a stable label/value format to support automated PDF extraction and validation in the IT Operations Tracker application.

Field	Value
report_period	January 2026
department	IT Operations
report_id	ITOPS-NNG-2026-01
report_date	06 January 2026
generated_time	06 January 2026, 12:37 WIB
report_status	Final
primary_application	Nimbus Notification Gateway
supporting_server	Vespera Integration Node
supporting_system	Atlas Workflow Console
reporting_cycle	Monthly
availability	99.62%
messages_processed	1,486,230
incidents	19
tickets	154
sla_compliance	96.1%
planned_maintenance	5
completed_maintenance	5
unplanned_maintenance	1
maintenance_downtime	0h 52m
overall_status	Stable

End of Report. This synthetic report is intended for operational tracking, PDF extraction testing, dashboard prototyping, and application-security/data-quality demonstrations.
